General Information

CPAchem is a French-Bulgarian company, located in Bulgaria.

Since 1998, we have been manufacturing a higher class of standard solutions and reagents in inorganic and organic.

CPAchem. is well recognized as a leader in production of **custom-made standard solutions according to customers specific requirements**. More than 4000 laboratories worldwide trust our brand based on the experience gained through the years.

CAPABILITIES

Complete range of analytical standards

- **CPA-spectr** : Inorganic calibration standards for Atomic Spectrometry (AAS, Graphite Furnace and ICP), Mass Spectrometry (ICP-MS) and Ion Chromatography.
- **CPA-pharm** : European Pharmacopoeia Reagents and Standards (Primary Opalescence Suspension & Colour solutions, Conductivity standards & Reference Buffer solutions, Reagents & Volumetric solutions, Ready to use Volumetric solutions)
- **CPA-org** : Organic analytical standards for residue analysis and environmental analysis (pesticides, pesticides metabolites, Deuterium and C13 labelled compounds, other...).

Custom manufacturing

- **Custom standard solutions in Organic**
- **Custom mono & multi-element standard in Inorganic**
- **Custom standards solution & reagents in Pharmacopoeia**

OUR TECHNOLOGY

The control of all the processes is fully automated by our dedicated Computer Aided Manufacturing (CAM) software, in addition to the modern network SQL –based data collecting system. The software system performs and controls the following :

- Automated calculations
- Barcode-driven movement
- Computer control of balances and other hardware.
- Incoming control of the raw materials
- Manufacturing and control of the intermediate solutions (bulks)
- Preparation of a custom-made solution (the program determines the needed weights and controls the gravimetric process on the analytical balances)
- Control of the final product (AAS, ICP, IC, GC, GC-MS, HPLC, LC-MS)
- Evaluating the final date, received by both gravimetric and instrumental analysis and calculating the certified values and uncertainties
- Automatic printing of labels, certificates and MSDS
- Automatic printing of Delivery Note for the products intended to be exported in order to obtain a full traceability every product and raw material is marked with a barcode.

OUR QUALITY

Each standard is rigorously tested and analyzed as a finished product and accompanied with a certificate of analysis and material safety data documentation.

Our products are manufactured under quality management system which has been introduced to the requirements of **ISO 9001:2000** and certified by Lloyd's Register Quality Assurance. We are currently in-process of implementing **ISO 17025** quality standards.

Custom Standards Information

GRAVIMETRIC DATA

A gravimetric certificate is provided with all standard mixtures, with the following informations :

- purity of the compound
- source of raw material with lot number
- concentration

EXPIRY DATES

An expiry date is printed on both solution label and on the certificate

INDEPENDENT LOTS

Differents lots are available . please specify " 2 differents lots".

SOLVENTS

Acetone	Dichloromethane	Iso-Octane	Petroleum Ether
Acetonitrile	Dimethylsulfoxide	Methanol	2- Propanol
Benzene	Ethanol	Methyl-tert-butylether	Tetrahydrofuran (THF)
Carbon disulfide	Ethyl acetate	n-Nonane	Toluene
Cyclohexane	n-Heptane	n-Octane	Water
Chloroform	n-Hexane	n-Pentane	Xylene

According to your specific needs other solvents are available.

Packaging information

Ampoules

1 ml – 2 ml
5 ml – 10 ml

Certan® bottle

1, 5 ml – 4,5 ml
10 ml

Amber bottle

20 ml – 40 ml

Headspace Ampoules

10 ml – 20 ml

You can offer other bottles according your needs.

Abbreviation Terms

AC / ACs	Aromatic Compounds	PCB / PCBs	Polychlorinated Biphenyls
NCC / NCCs	Nitrogen-Containing Compounds	PAH / PAHs	Polycyclic Aromatic Hydrocarbons
OC / OCs	Organochlorine Pesticides	VOC / VOCs	Volatile Organic Compounds
OPP / OPPs	Organophosphorus Pesticides	P & T	Purge & Trap

Take advantage of our CUSTOM MULTI-ELEMENT SOLUTIONS

- *Quotations supplied quickly*
- *Mixtures made for your special needs*
- *Analysis Certificates according with the requirements of ISO 17025*
- *Available in ampoules, Certan[®], headspace bottle or other*

Description of the RM subject to calibration: n-Alkane Standard Solution 6 components acc. ISO 9377-2-Mod in n-Hexane

Catalog number: 9BAD.K1.ZT.1

Calibration: CRM's calibration procedure

Result from (certified value) / Uncertainty:

Component	№	Certified Value (mg/l)*	Uncertainty
n-Decane	124-18-5	50	0.70
n-Hexadecane	544-76-3	50	1.31
n-Eicosane	112-95-8	49	1.68

n-Triacontane	638-68-6	50	0.94
n-Tetracontane	4181-95-7	50	1.01

* The expanded traceability of metrological traceability of the reference material corresponds to a confidence level of 95% with EA 4/02.

Metrological traceability: n-Decane, n-Hexadecane, n-Eicosane, n-Tetracosane, n-Triacontane, n-Tetracontane

The metrological traceability of the reference material is established by a series of standard solutions prepared from a primary standard.

The calibration curve is linear and the reference material is traceable to SI. All components are considered when evaluating the uncertainty.

Water quality - Determination of certain organochlorine insecticides, polychlorinated biphenyls and chlorobenzenes - Gas chromatographic method after liquid-liquid extraction.

Describes a method for determining certain organochlorine insecticides, polychlorinated biphenyls (PCBs) and chlorobenzenes (except the mono- and dichlorobenzenes) in drinking water, ground water, surface waters and waste waters. The method is applicable to samples containing up to 0,05 g/l of suspended solids.

ISO 7981-2:2005**Water quality - Determination of polycyclic aromatic hydrocarbons (PAH) - Part 2: Determination of six PAH by high-performance liquid chromatography with fluorescence detection after liquid-liquid extraction.**

ISO 7981-2:2005 specifies the determination of six selected PAH in drinking, mineral and table waters and ground and surface waters in mass concentrations above 0,005 micrograms per litre by high-performance liquid chromatography with fluorescence detection after liquid-liquid extraction. The six PAH are: fluoranthene, benzo[b]fluoranthene, benzo[a]pyrene, benzo[k]fluoranthene, indeno[1,2,3-cd]pyrene, and benzo[ghi]perylene. With some modification, this method is also applicable for the analysis of moderately polluted waste waters.

ISO 8165-1:1992**Water quality - Determination of selected monovalent phenols -- Part 1: Gas-chromatographic method after enrichment by extraction.**

This international method specifies a method for determining phenols by a gas chromatographic method. The determination of selected phenols and nitrophenols in drinking water, ground water and surface water. The method provides a procedure for solid-phase extraction of nitrophenols, followed by solvent elution, derivatization with diazomethane and determination by gas chromatography and mass spectrometry.

Water quality - Determination of selected monovalent phenols - Part 2: Method by derivatization and gas chromatography

This international method specifies a method for the determination of phenols by gas chromatography, following pentafluorobenzoyl chloride derivatization. It may in particular be applied to the examination of drinking water, ground water and moderately contaminated surface water. With this method, lower limits of detection may be obtained compared with extraction procedures.

Water quality - Determination of hydrocarbon oil index - Part 2: Method using solvent extraction and gas chromatography

The method of choice for the determination of oil and grease in water is based on extraction with hydrocarbon solvent like pentane or hexane.

This test determines the hydrocarbon oil index in water by means of gas chromatography. The method is suitable for surface water, waste water, and water from sewage treatment plants, and allows the determination of the hydrocarbon oil index in concentrations above 0.1 mg/l.

The index is the sum of compounds with retention times between n-decane and n-tetracontane. Substances complying with this definition are long-chain or branched aliphatic, alicyclic, aromatic or alkylsubstituted aromatic hydrocarbons.

ISO 9377-2 :Mod

Water quality -Determination of hydrocarbon oil index down to C7

A modified method for oil in water analysis of produced water from offshore petroleum production installations has recently been taken into force.

ISO 9377-2 is not applicable for volatile hydrocarbons, and a modification of the method is proposed by the OSPAR commission in order to include the determination of certain hydrocarbons with boiling points between 98 and 174 °C from produced water.

The OSPAR Reference Method of Analysis for the Determination of the Dispersed Oil Content in Produced Water.

ISO 9562 :2004**Water quality - Determination of absorbable organically bound halogens (AOX)**

This European standard specifies a method for the direct determination of an amount of more than 10 microgram/l in water of organically bound chlorine, bromine and iodine (expressed as chloride) absorbable on activated carbon. The concentration of inorganic chloride ions in the test sample (see clause 8) needs to be less than 1 g/l. Samples with higher concentrations need to be diluted prior to analysis. For samples containing suspended solids, halogens adsorbed onto the solid matter are also included.

ISO 14154:2005

Soil quality - Determination of some selected chlorophenols - Gas-chromatographic method with electron-capture detection

ISO 14154:2005 describes the gas chromatographic determination of 15 chlorophenols in soil samples. This method can also be applied to other solid samples such as sediments and solid wastes.

ISO 14154:2005 describes an acid-base liquid extraction, followed by acetylation and then liquid/liquid extraction. Determination of mass concentration is then carried out by gas chromatography and electron-capture detection.

ISO 15753:2006**Animal and vegetable fats and oils - Determination of polycyclic aromatic hydrocarbons**

ISO 15753:2006 describes two methods for the determination of 15 polycyclic aromatic hydrocarbons (PAHs) in animal and vegetable fats and oils: a general method, and a method specific for coconut oil and short-chain vegetable oils.

These methods are not quantitative for the very volatile compounds such as naphthalene, acenaphthene and fluorene. Due to interferences provided by the matrix itself, palm oil and olive pomace oil cannot be analysed using this method.

Water quality - Determination of dioxin-like polychlorinated biphenyls - Method using gas chromatography/mass spectrometry

ISO 17858:2007 specifies a method for the determination of dioxin-like tetra- to hepta-chlorinated biphenyls (PCBs) in waters and wastewaters (containing less than 1 % suspended solids) using high-resolution gas chromatography/high-resolution mass spectrometry (HRGC/HRMS). The minimum levels at which the dioxin-like PCBs can typically be determined with no interferences present are specified. This method is "performance based". The analyst is permitted to modify the method to overcome interferences or lower the cost of measurements, provided that all performance criteria in this method are met. The requirements for establishing method equivalency are given.

ISO 18287:2006 specifies the quantitative determination of 16 polycyclic aromatic hydrocarbons (PAH) according to the priority list of the Environmental Protection Agency, USA (EPA, 1982). ISO 18287:2006 is applicable to all types of soil (field-moist or chemically dried samples), covering a wide range of PAH contamination levels. Under the conditions specified in ISO 18287:2006, a lower limit of application of 0,01 mg/kg (expressed as dry matter) can be ensured for each individual PAH.

This part of ISO 18857 specifies a method for the determination of 4-nonylphenol (mixture of isomers) and 4-(1,1,3,3-tetramethylbutyl)phenol in non-filtered samples of drinking water, ground water and surface water. The method is applicable in a concentration range from 0,005 Bµg/l to 0,2 Bµg/l for 4-(1,1,3,3-tetramethylbutyl)phenol and from 0,02 Bµg/l to 0,2 Bµg/l for 4-nonylphenol (mixture of isomers). Depending on the matrix, the method is also applicable to waste water in a concentration range from 0,1 Bµg/l to 50 Bµg/l. Higher concentrations may be measured after appropriate dilution of the sample.

Water quality - Determination of parathion, parathion-methyl and some other organophosphorus compounds in water by dichloromethane extraction and gas chromatographic analysis

This European Standard specifies the extraction processes and gas chromatographic (GC) methods for determining parathion, parathion-methyl and some other organophosphorus compounds in drinking waters, surface waters and waste waters. This standard may also be suitable for the determination of other organic compounds. The range is dependent on the compound and the source of water and is typically up to 1 µg/l with a reporting limit of 0,001 µg/l for drinking waters involving a 1 000 to 1 extraction ratio.

Packaging - Flexible packaging material - Determination of residual solvents by static headspace gas chromatography - Part 2: Industrial methods

This part 2 should be read in conjunction with prEN (261190) part 1 and describes rapid methods as commonly used in quality control for example for monitoring the level of residual solvents used in the production of flexible packaging by static headspace chromatography. The procedure described in this part involves one single injection of the headspace which implies an incomplete extraction of the solvent. The values obtained may be lower than the absolute content which should be determined according to Part 1. During the analysis there may be interferences from possible products of thermal decomposition.

Characterization of waste - Determination of hydrocarbon content in the range of C10 to C40 by gas chromatography

This document specifies a method for the quantitative determination of the hydrocarbon content (C10 to C40) in solid waste by gas chromatography.

It is applicable to hydrocarbon content between 100 mg/kg and 10 000 mg/kg expressed as dry matter basis.

Using this standard all hydrocarbons with a boiling range of approximately 175 B°C to 525 B°C, e.g. n-alkanes from C10H22 to C40H82, isoalkanes, cycloalkanes, alkyl benzenes, alkyl naphthalenes and polycyclic aromatic compounds are determined as hydrocarbons, provided they do not adsorb on the Florisil column during clean-up.

Standard Test Method for Acid Number of Petroleum Products by Potentiometric Titration

This test method covers procedures for the determination of acidic constituents in petroleum products and lubricants soluble or nearly soluble in mixtures of toluene and propan-2-ol. It is applicable for the determination of acids whose dissociation constants in water are larger than 10⁻⁹; extremely weak acids whose dissociation constants are smaller than 10⁻⁹ do not interfere. Salts react if their hydrolysis constants are larger than 10⁻⁹. The range of acid numbers included in the precision statement is 0.1 mg/g KOH to 150 mg/g KOH.

Standard Test Method for Boiling Range Distribution of Petroleum Fractions by Gas Chromatography

This test method covers the determination of the boiling range distribution of petroleum products. The test method is applicable to petroleum products and fractions having a final boiling point of 538°C (1000°F) or lower at atmospheric pressure as measured by this test method. This test method is limited to samples having a boiling range greater than 55°C (100°F), and having a vapor pressure sufficiently low to permit sampling at ambient temperature.

EPA methods 500 for Drinking Water

The 500 Series product line contains standards used in proposed and promulgated methods for the identification and quantification of organic compounds in drinking water. The organic compounds listed in the various methods include volatile organic compounds (VOCs), pesticides, synthetic organic compounds (SOCs), and trihalomethane disinfection by-products. Analytical techniques used in the identification and quantification of the above compounds include gas chromatography with selective detectors (PID, ELCD, ECD, FID, NPD, FPD), gas chromatography/mass spectrometry and high performance liquid chromatography.

EPA method 501

Trihalomethane Analysis

Method 501 is a purge and trap method for measurement of total trihalomethanes in raw source water, or drinking water in any stage of treatment, and in finished drinking water by gas chromatograph.

EPA method 502

Volatile Organic Compounds in Water

EPA Method 502.1 identifies volatile halogenated organic compounds, in water, by purge and trap gas chromatography.

EPA Method 502.2 is an enhanced and expanded version 502.1. It is a general purpose method for the identification and measurement of purgeable volatile organic compounds in finished drinking water, raw source water, or drinking water in any treatment stage.

EPA method 508, 508.1, 508A

Chlorinated pesticides and PCBs

Method 508 is applicable to the determination of chlorinated pesticides in ground water and finished water by gas chromatography with an electron capture detector.

Method 508.1 is applicable to the determination of chlorinated pesticides, herbicides, and organohalides in ground water and drinking water in any treatment stage using extraction and electron-capture detector gas chromatography.

Method 508A is applicable for screening of Polychlorinated Biphenyls (PCBs) by gas chromatography in raw source water or drinking water in any treatment stage.

EPA method 515.1 & 515.2

Chlorinated Acids

Method 515.1 is applicable to the determination of certain chlorinated acids in ground water and finished drinking water.

Method 515.2 is applicable to the determination of chlorinated acids in ground water, and finished drinking water, using extraction, derivation, and gas chromatography with electron capture detector.

Method 515.3 is applicable to the determination of chlorinated acids in drinking water, ground water, raw source water, and water at any intermediate stage by extraction, derivation, and gas chromatography with electron capture detector.

EPA method 556 & 556.1

Determination of carbonyl compounds in drinking water by pentafluorobenzylhydroxylamine derivatization and capillary Gaz chromatography with electron capture detection

This is a gas chromatographic method optimized for the determination of carbonyl compounds in finished drinking water and raw source water. The primary difference between method 556 and 556.1 is that crotonaldehyde has been removed from the analyte list in the 556.1 method.

Aldehydes Mixtures (556 & 556.1) - 14 components

EPA methods 8000 Series

The EPA 8000 methods are designed for monitoring organic pollutants in ground water, as prescribed in the Resource Recovery and Conservation Act (RCRA).

EPA method 8010B**Halogenated volatile organics by GC**

Method 8010 provides gas chromatographic conditions for the detection of halogenated volatile organic compounds. Samples can be introduced into the GC using direct injection or purge-and-trap (Method 5030). Ground water samples must be analyzed using Method 5030. A temperature program is used in the gas chromatograph to separate the organic compounds. Detection is achieved by a electrolytic conductivity detector (HECD).

EPA method 8030A

Acrolein and acrylonitrile by GC

Method 8030 provides gas chromatographic conditions for the detection of the target analytes. Samples can be analyzed using direct injection or purge and-trap (Method 5030). Tenax should be used as the trap packing material. Ground water samples must be analyzed using Method 5030. A temperature program is used in the gas chromatograph to separate the organic compounds. Detection is achieved by a flame ionization detector (FID).

Determination of carbonyl compounds by HPLC

This method provides procedures for the determination of free carbonyl compounds in various matrices by derivatization with 2,4-dinitrophenylhydrazine (DNPH). The method utilizes high performance liquid chromatography (HPLC) with ultraviolet/visible (UV/vis) detection to identify and quantitate the target analytes. This method includes two procedures encompassing all aspects of the analysis (extraction to determination of concentration). Procedure 1 is appropriate for the analysis of aqueous, soil and waste samples and stack samples collected by Method 0011. Procedure 2 is appropriate for the analysis of indoor air samples collected by Method 0100.

EPA method 8321A

Solvent extractable non volatile compounds by HPLC/ Thermospray/ Mass Spectrometry (HPLC/TS/MS) or ultraviolet (UV) detection

This method covers the use of high performance liquid chromatography (HPLC), coupled with either thermospray-mass spectrometry (TS-MS), and/or ultraviolet (UV), for the determination of disperse azo dyes, organophosphorus compounds, and tris(2,3-dibromopropyl)phosphate, chlorinated phenoxyacid compounds and their esters, and carbamates in wastewater, ground water, and soil/sediment matrices. Data are also provided for chlorophenoxy acid herbicides in fly ash, however, recoveries for most compounds are very poor indicating poor extraction efficiency for these analytes using the extraction procedure included in this method. Additionally, it may apply to other non-volatile compounds that are solvent extractable, are amenable to HPLC, and are ionizable under thermospray introduction for mass spectrometric detection or may be determined by a UV detector.

Gas chromatography/ Fourier transform infrared (GC/FT-IR) spectrometry for semivolatile organics: capillary column

This method covers the automated identification, or compound class assignment of unidentifiable compounds, of solvent extractable semivolatile organic compounds which are amenable to gas chromatography, by GC/FT-IR.

GC/FT-IR can be a useful complement to GC/MS analysis (Method 8270).

Residual Solvents in Medical Products

The analysis of residual solvents in pharmaceutical products has changed, particularly for products being sold into Europe. The International Conference on Harmonization (ICH) Guidelines for Residual Solvents is becoming the international standard and is being adopted by more pharmacopoeias, including the European and United States Pharmacopoeia, every year. The ICH method and compound list is more extensive than any method previously used and poses new challenges. Compounds in Class 1 are solvents considered to be of highest risk and to be avoided in pharmaceutical manufacturing. Use of Class 2 compounds is to be limited, as they pose a lower, but present, threat to health. Compounds in Class 3 pose the lowest toxic potential and may be used routinely in manufacturing.

Revised USP 467 Residual Solvent Method

On July 1, 2008, the USP released a new major revision of its general chapter <467>: now entitled *Residual Solvent Analysis*. Closely resembling the International Conference on Harmonization's Q3C Guideline, the chapter applies to all compendial drug substances and products and provides concentration limits of Class 1, 2, and 3 residual solvents.

European Pharmacopoeia Reagents and Standards

Our Range of standards *CPA-Pharm*

- Primary Opalescence Suspension
- Primary Colour Solutions
- Conductivity Standard Solutions
- Reference Buffer Solutions
- Reagents and Volumetric Solutions
- Ready to use Volumetric Solutions

The complete range is:

- manufactured in accordance with the European Pharmacopoeia,
- traceable to primary standards from NIST-CRM,
- provided with a Certificate of Analysis.

Organic Standard Solution

This document is designed and the certified value(s) and uncertainty(ies) are determined in accordance with ISO Guide 31^[1], ISO Guide 35^[2], and Eurachem / CITAC Guides^[3]

№ S82540

Barcode: 92095656

Certification Date: 27.10.2010

Description of the Reference Material (CRM):

Solution of: 6 components; 10mg/l each of 2-Methylphenol [CAS:95-48-7] ; Phenol [CAS:108-95-2] ; 3-Methylphenol [CAS:108-39-4] ; 4-Methylphenol [CAS:106-44-5] ; 2,6-Dimethylphenol [CAS:576-26-1] ; 2,5-Dimethylphenol [CAS:95-87-4] ;

Ref number:

9835.10.ML.10

Concept of Certification and traceability statement:

This certified reference material is produced by gravimetric measurement and dissolving the individual substances in Methanol .

Method of certification:

CRM's calibration procedure (CP-002)

The certified value was obtained gravimetrically and confirmed experimentally by GC/MS or HPLC

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $k = 2$, which for a normal distribution corresponds to a coverage probability of approximately 95%. The standard uncertainty of measurement has been determined in accordance with EA 4/02

Property of the result of a measurement whereby it can be related to stated references, usually national or international standards, through an unbroken chain of comparisons all having stated uncertainties (ISO VIM^[5])

The metrological traceability is assured through gravimetric measurement and dissolving the certified reference material from accredited according to ISO/IEC 17025^[6] and/or ISO Guide 34^[7] laboratories/producers and traceable to SI. All contributions in relation to the certification of standard solutions are considered when evaluating the uncertainty.

The measurement results are traceable to SI. All analytical balances used for the preparation of the solution are calibrated yearly under an in-house procedure with class E1 and class E2 analytical weights, traceable to SI and are daily checked.

Class A laboratory glassware is used.

The results from temperature measurement are traceable to SI. The thermometers used for solution's calibration are calibrated from an ISO 17025 accredited laboratory. The ambient conditions are controlled with a hygrometer calibrated from an ISO 17025 accredited laboratory.

Both, purity of the starting materials and solvent were checked using appropriate analytical instrument.

Starting material, purity (Lot N):

2-Methylphenol	99.3% (41039199)
Phenol	99.5% (41038703)
3-Methylphenol	99.5% (41039540)
4-Methylphenol	99% (41038826)
2,6-Dimethylphenol	98.8% (41039854)

Density:

0.7907 g/cm³ at 21.3 °C

Expiry date:

until 11.2012

Intended use:

For Laboratory Use Only

This CRM is intended for:

- Calibration of TLC, GC/FID, GC/TCD, GC/ECD, GC/MS, HPLC/UV and HPLC/MS
- Validation of analytical methods
- Preparation of "working reference samples"
- Detection limit and linearity studies

This statement is not intended to restrict the use for other purposes.

Instructions for the correct use of this reference material:

This certified reference material can be used directly or can be diluted in an appropriate solvent. Only a clean class A glassware should be used. Do not pipet from container. Obtained concentration (in mg/l) after dilution is a result from the multiplication of certified value of CRM concentration and the CRM's volume used for dilution and divided into the flask's volume used for dilution.

Certificate of Analysis

Stability and storage:

This CRM is with a guaranteed stability until $\pm 0.5\%$ of the certified concentration for a period of 24 months. Stability is guaranteed provided that the solution is kept in its original packaging, tightly closed under normal laboratory conditions. According to an in-house procedure (OQP 5.14.1) the producer will monitor this CRM at appropriate intervals and the purchasers will be notified of any significant changes resulting in recertification or with withdrawal of the CRM during the state period of the validity of the certificate.

Hazardous situation:

The normal laboratory safety precautions should be observed when working with this RM. Further details for the handling of this RM are available as safety data sheet.

Level of homogeneity

This solution was mixed according to an in-house procedure (OQP 5.13.1) and is guaranteed to be homogeneous. To ensure sufficient homogeneity of the sample prior to use thoroughly mix by inversion.

This Certified Reference Material was produced under ISO 9001 Quality Control System. The instructions of the ISO Guide 34^[7] were considered for the preparation of this solution.
