CARBURATION SIMULATED TEST

£ 80.00

## information on processing

The car is tested before and after the intervention on a roller power test bench and the graphs with the results are printed and delivered to the customer.

The mapping was developed by t.r.a racing specifically to work without any problem with the DPF filter

(Particulate filter) installed on the car and also allows you to carry out the emissions checks required during vehicle overhaul.

The manufacturer's diagnostic tools work perfectly and do not detect any anomalies allowing you to perform the warranty service.

The original car software is delivered on mini-cd to the customer.

In the event of a software update of the control unit by the manufacturer, the customer can contact us for a new appointment to re-map the new software for free or with a small expense on more complex control units.

It is possible to request reprogramming with the original software at any time free of charge (for example in the case of car sales).
